Let's say we have an array such as: int someArray[5]; Now, I can resize this array as follows: someArray = malloc(sizeof(int) * 10); But what if I needed to resize it without having to reallocate a new array and copy all of the values over, is there a way to do this? A: You can't, but there is a way to minimise unnecessary copying. Depending on how you need to resize the array, there are two main ways of doing this: 1) Pass the new size to the function char* someFunction(char* c, int n) { if(c == NULL) { // construct a new one c = malloc(n); } else { // construct a new one from an old one of the same size char* temp = malloc(n); memcpy(temp, c, n); free(c); c = temp;

A: You could use lxml: from lxml import etree root = etree.Element('root') nodes = [Element('heading', children=[Element('paragraph', children='text text text text text text'), Element('paragraph', children='text text text text text text')])] root.append(nodes) tree = etree.ElementTree(root) tree.write('test.xml') Q: How to set a property in an other class? I know that in the same class there is no problem to set a property and I am able to use it. public partial class Signin : System.Web.UI.Page { public string Email = ""; In another class I try to set the same property. public partial class Person : System.Web.UI.Page { public Person() { InitializeComponent(); } private Signin signin = new Signin(); protected void Page_Load(object sender, EventArgs e) { Signin.Email = ""; Button4.Text = "login"; Button4.Enabled = false; } } When I run it I get the error: The name 'Email' does not exist in the current context A: You need to store it as a static property, because you can't access any instance properties from a static method. Techweekz | 2018-03-11 To be truly connected, within a company or organizational network, one must first have access to the data. In 2018, data is power, but when you are trying to establish a connection, it is easy to forget how difficult edd6d56e20
